Title : Analysis of Radiactive Granite from Karkonosza

Orig Pub : Arch. mineralog., 1955, (1956), 19, No 1, 9-16

Abstract : Composition of the granite under study (in % by volume): quartz 32.4, feldspar 6.2, biotite 5.0, and also traces of pyrite, zircon, oxides of iron and apatite. Radioactivity was determined by three procedures: 1) application of plates bearing a nuclear emulsion to polished surface of the rock, 2) application of the same plates to the rock ground to a powder and compressed into tablets, and 3) covering with liquid nuclear emulsion of thin microscopic sections of the granite. It was found that radioactive substance is distributed over the entire surface of the rock under study in the form of very minute crystals of zircon and apatite. A lesser degree of

Decontamination of Fabrics Used in the Manufacture of Protective Clothing and Having Been Contaminated by Radioisotopes

2% oxalic acid and 6) 1.5% solution of sodium silicate. It was established that decontamination achieved by means of common water was 69.0 - 77.45% for linen fabric, 60.65 - 71.70% for cotton fabric, 67.10 - 83.87% for polyethylene foil and 58.0 - 80.6% for polyvinyl chloride foil. Decontamination achieved by repeated consecutive washing in common water and in the solutions of citric, oxalic and sulfuric acids was 92.28 - 99.73% for linen fabric, 94.16 - 99.20% for cotton fabric, 99.87% for polyethylene foil and 99.64% for polyvinyl chloride foil. The author concludes that good decontamination agents are citric acid (or sodium citrate), 0.05 n sulfuric acid and sodium silicate, whereas oxalic acid and the washing agent "Saponina" are less efficient. ✓

TITLE:

Protective Clothing for ¹⁹Decontamination Work

PERIODICAL: Nukleonika, 1960, Vol. 5, No. 6, pp. 377 - 378

TEXT:

The authors tested two common fabrics used in protective clothing: BT type cotton fabric coated with natural rubber and BT type cotton fabric coated with softened polyvinyl chloride. Samples of the materials were contaminated by ^{32}P , ^{45}Ca , ^{60}Co , ^{90}Sr and ^{134}Cs and subjected to decontamination. Decontamination agents used were: common hot water, 0.05% hydrochloric, nitric and sulfuric acids and 2% sodium citrate. One-time washing in hot water resulted in 81 - 87% decontamination of both fabrics. Subsequent washing in hot acid solutions resulted in 97 - 98% decontamination for rubber-coated fabric and 98 - 99.1% for polyvinyl chloride coated fabric. The protective garment was a 2-section suit with body-tightened arm and leg sleeves; the tightened cap was provided with an opening for face and oxygen mask. An oxygen apparatus type FSR M-56 is provided; the operational span is 1 - 2 h and weight 12 kg. Rubber gloves are an access-

Title : The Germinating Ability of Oleaginous Pumpkin Seeds Laid
For the Winter in the Fruit Stored at Low Temperature.

Orig Pub : Roczn. nauk rolniczych, 1956, 4721, No 3, 527-528.

Abstract : An experiment was started at the Institute of Genetics
and Plant Growing in Poznan (Poland) in which the fruit
of two varieties of oleaginous pumpkin matured in the
fall of 1954 were stored for the winter in an unheated
lothouse. At the beginning of spring the seeds from
these pumpkins were checked for germinating ability and
the vigor of sprouting. During storage the temperature
in the lothouse dropped once to -17° and in January and

Card 1/2

- 124 -

Sugar-bearing.

Abs Jour : Red Star - Biol., No 10, 1956, 44248

In January it averaged -40 to -30° . This resulted in the
pumpkin fruit being frozen rough. In the spring the
pumpkins thawed out. In the state of complete disinte-
gration of the flesh the seeds were removed from it, rin-
ced in water and then they were left in a glass jar at
room temperature for 3 days. After this the seeds were
dried out at a temperature of $40-45^{\circ}$ and dried on filter
paper in Petri dishes. The vigor of sprouting and the
germinating ability of the seeds of both varieties was
normal. -- V.B. Tschak

TITLE: A linear pulse amplifier

PERIODICAL: *Elektronika*, v. 5, no. 9, 1960, 569 - 573

TEXT: A linear pulse amplifier with a pulse-height discriminator is described. The overall gain of the amplifier is 120 dB for frequencies ranging from 10 kc/sec to 3 Mc/sec. It has been designed for use in connection with detectors of ionizing radiations. The amplifier is built in two separate units connected by cable so that the first unit (preamplifier) can be placed directly adjacent to the detector. Each unit comprises a three-stage tube circuit with a strong negative feedback, with low-capacitance pentodes in the first two stages, the third stage being a cathode follower. To ensure maximum stability, the resistors of the potential divider for the negative feedback are wound with constantan. In order to reduce noise, a resistance of 50 Mohm was

in the entire range of the generated frequencies, and react only to the momentary input frequency. Such a voltmeter consists actually of two instruments: one of them shows the composite value equal or opposite in phase to the input, the other one a composite value shifted by 90° . They are actually wattmeters calibrated in volts. As the measured frequencies may start with a fraction of a cycle, and watt-meters operate correctly only above 20 cycles, thermocouples have been employed. The thermocouples have been connected in opposite directions, so that the reading of the meter is proportional to the difference of the thermoelectromotive forces of both thermocouples: $\alpha_1 = K_2 (e_2 - e_1)(2)$, or: $\alpha_1 = K_6 U_s \cos \psi (9)$. As $\cos \psi$ may assume both positive and negative values, the meter must be zeroed in the middle of the scale. The instrument does not react to signals other than those of the reference frequency: $u_0 = U_0 \sin \omega t$. One of the essential parts of the low-frequency generator (several hundredths of a cycle up to several hundreds of cycles) is a phase-shifting circuit of a CR type. To excite oscillations another similar circuit must be added (90° phase shift), and an amplifying stage with regulated plate current. Assuming that the adding circuit has no damping effect, the amplification of the loop will be 0.9 (theoretical

AUTHOR: Szwaja, Zygmunt

TITLE: Low level magnetic amplifiers

PERIODICAL: Archiwum automatyki i telemekhaniki, v. 7, no. 1-2,
1962, 199 - 210

TEXT: Characteristic parameters and results of tests performed on low level magnetic amplifiers which can be controlled from such sources as thermocouples or photovoltaic cells are presented. The magnetic circuits with reactors, rectifiers and sometimes capacitors are considered. Two types of amplifiers are studied: a push-pull d.c. center-tap amplifier (4 reactors and 4 rectifiers in one stage) and an even-harmonic type amplifier (2 reactors and 2 rectifiers in one stage). The object of experiments was to study the problem of zero stability and central characteristics stability of amplifiers at variable supply voltage and at operating temperatures. There are 12 figures.

Szwankowski E. Warsaw.

Warszawa . Warszawa, 1952, FWT, 16°, 341 pp, 452 figs.

This book contains a historical review of the town
planning and architectural development of Warsaw.

This development covers a period dating from the time
of medieval settlement on the site of the present
city to the outbreak of war in 1939. The book is in-
tended for town planning engineers, architects,
historians and all interested in the country's
culture and in urban development.

Lublin. * Schorzenia oka w przebiegu brucelozy. The eye complica-
tions in brucellosis POST.OKULIST. 1956, 3 (177-184)

The author presents a series of 8 patients with keratitis nummularis and 124 with
iridocyclitis. In two cases with iridocyclitis positive serological reaction and Bur-
nett's allergic reaction were found. One assumes that most frequent localization of
the eye manifestations is the cornea and the uvea. One may treat it with antibiotics
and brucellin PD, if necessary combined with sulphonamides. Szmyt - Łódź

Titlo	: Immunological Reactions in Experimental Infection of the Cornea by Brucellae (Preliminary Report)
Orig Pub.	: Klin. oczna, 1957, No 4, Dodatek, 375-377
Abstract	: According to data in the literature, keratitis nummularis is most often produced by brucellous infection which is confirmed by serological and allergic tests and the results of specific therapy. The authors observed eight patients with keratitis nummularis in whom serological and allergic tests for brucellosis were negative and clinical manifestations of brucellosis were absent. The authors supposed that in cases of infections of the eye with weakly virulent strains of brucellae the local process cannot produce a general immunization of the body. With the aim of checking this idea, several groups of rabbits were infected intra- corneally with virulent strains of brucellae and strain

Title : Histochemical Investigation of the Distribution and Activity of Phosphatase During the Course of Development of a Postoperative Corneal Scar

Orig Pub : Klin. oczna, 1957, No 4, Dodatek, 398-405

Abstract : A study was made of the localization and activity of adenosinetriphosphatase, 5-nucleotidase and non-specific phosphatases in the cornea of healthy rabbits and in the corneas of rabbits at various intervals following keratoplasty by the G6mbri method in the Thorbrodt modification. Normally, phosphatases are found only in the corneal epithelium. After keratoplasty a high degree of activity of the enzymes is noted not only in the epithelium but also in the

Acquired albinism with Basedow's disease was diagnosed in 13 cases. They were treated during the period of 1952 to 1956. The methylthiouracyl treatment of hyperthyroidism caused a slower development of albinism symptoms. Patients in whom a complete cessation of albinism development was found showed a distinct lowering of the 17-ketosteroids content in the urine. (VI, 3, 13)

5497. TWO CASES OF PITUITARY TUMOURS WITH CLINICAL SYMPTOMS OF GRAVES' DISEASE - Dwa przypadki choroby Graves-Basedowa z nowotworami przysadki mózgowej - Szwarcowa H. and Huber Z. Wojewódzka Porad. Schorzeń Tarczycy, Poznań - ENDOKR. POL. 1958, 9/6 (337-340) Graphs 2 Illus. 2

The final regression of symptoms of Graves' disease in 2 boys aged 11 and 19 yr. was observed after a successful extirpation of the tumours. The tumours were histologically identified as adenomas: neutrophilic in the first case and eosinophilic in the 2nd. In both cases the appearance of the syndrome of Graves' disease should be connected with the pressure of adenoma and with its indirect influence on the function of the hypothalamus and hypophysis. (III, 5, 6, 16)

II, Wojewódzka Poradnia Chor. Tarczycy, Poznań - ENDOKR. POL. 1959,
10/1 (47-52)

Cases of vitiligo and hyperpigmentation in Graves' disease are not frequent and their course is usually stopped or inhibited when the hyperthyroidism is adequately treated. It is assumed that the incidence of hyperpigmentation is connected with the partial adrenal insufficiency observed in these patients. (III, 6, 13)

✓ Szwarczewski J. Technological Spinning Chart.

„Karta technologiczna przędzenia”. (Prace Inst. Ekonom. i Organ. Przem. No. 4(13)), Warszawa, 1953, PWT, 64 pp., 17 figs., 30 tabs.

The article contains a specimen of the „Technological Spinning Chart” and detailed instructions as to how to fill it in. The „Chart” is actually a systematically arranged collection of details illustrating the state of the machinery stock in spinning mills and of fundamental data regulating the proper sequence of the technological process. The instructions are a guide to the methods of filling in the chart and contain formulae for computations, drawings and tables which can be useful in the compilation of the spinning plan. The details contained in technological charts will, if carefully filled in, facilitate technical and economic analysis and, in particular, determination of self-cost, as well as control of work standards.
